

South Florida Municipality Uses ENECRETE & ENECLAD to Rescue Pump Room Floors

This south Florida municipality has once again selected ENECON to be a critical part of their canal water pump station infrastructure improvement and life extension program.

In addition to the pump and chemical storage area coating already completed by ENECON, the city is now restoring the concrete floors in several master pump control room stations.

Each station is equipped with four electronically controlled 200hp vertical

pumps and pre-filtration equipment.

ENECON's Fluid Flow Systems Specialist recommended the floors be repaired with ENECRETE DuraQuartz, primed with CHEMCLAD P4C and protected with ENECLAD FPS.

The work was completed by city personnel at the direction of the ENECON Specialist. The results of this project and the continual reliance on ENECON for these repairs, speak for themselves.
